DMW Computing-Concepts
Presents:
The HACKER-HAT

The HACKER-HAT is an hacker's dream come true. It combines the latest technology with portability and affordability. For the first-time-ever, the features usually found on large systems are available in this compact package, conveniently designed to be worn as a hat. The equipment is water, heat, and cold resistant. (Lightning insurance may also be purchased at a minimal cost.)

The HAT uses dual 16-bit microprocessors for incredible computing speed. It's supplied language is BASIC, but many other programming languages will be available soon.

An outside monitor is optional, but the 10-line, 80-column Liquid Crystal Display is sufficient for almost all of your display needs. For hard copies, and 80-column, letter-quality, thermal printer is provided.

The HAT comes with 64 K of magnetic bubble memory for program storage. A 270 K micro-disk drive allows external software use.

Different HATs can communicate between one-another over telephone lines using the HATmodem.

The power supply will last up to 8 hours before needing recharging.

The 55-key keyboard furnishes many features not found on most computers this size. It is a bit too small for standard touch-typing, but when did that ever stop a hacker?

One thing we know--The HACKER-HAT is a must for computer-buffs who need a complete system that goes where they go.

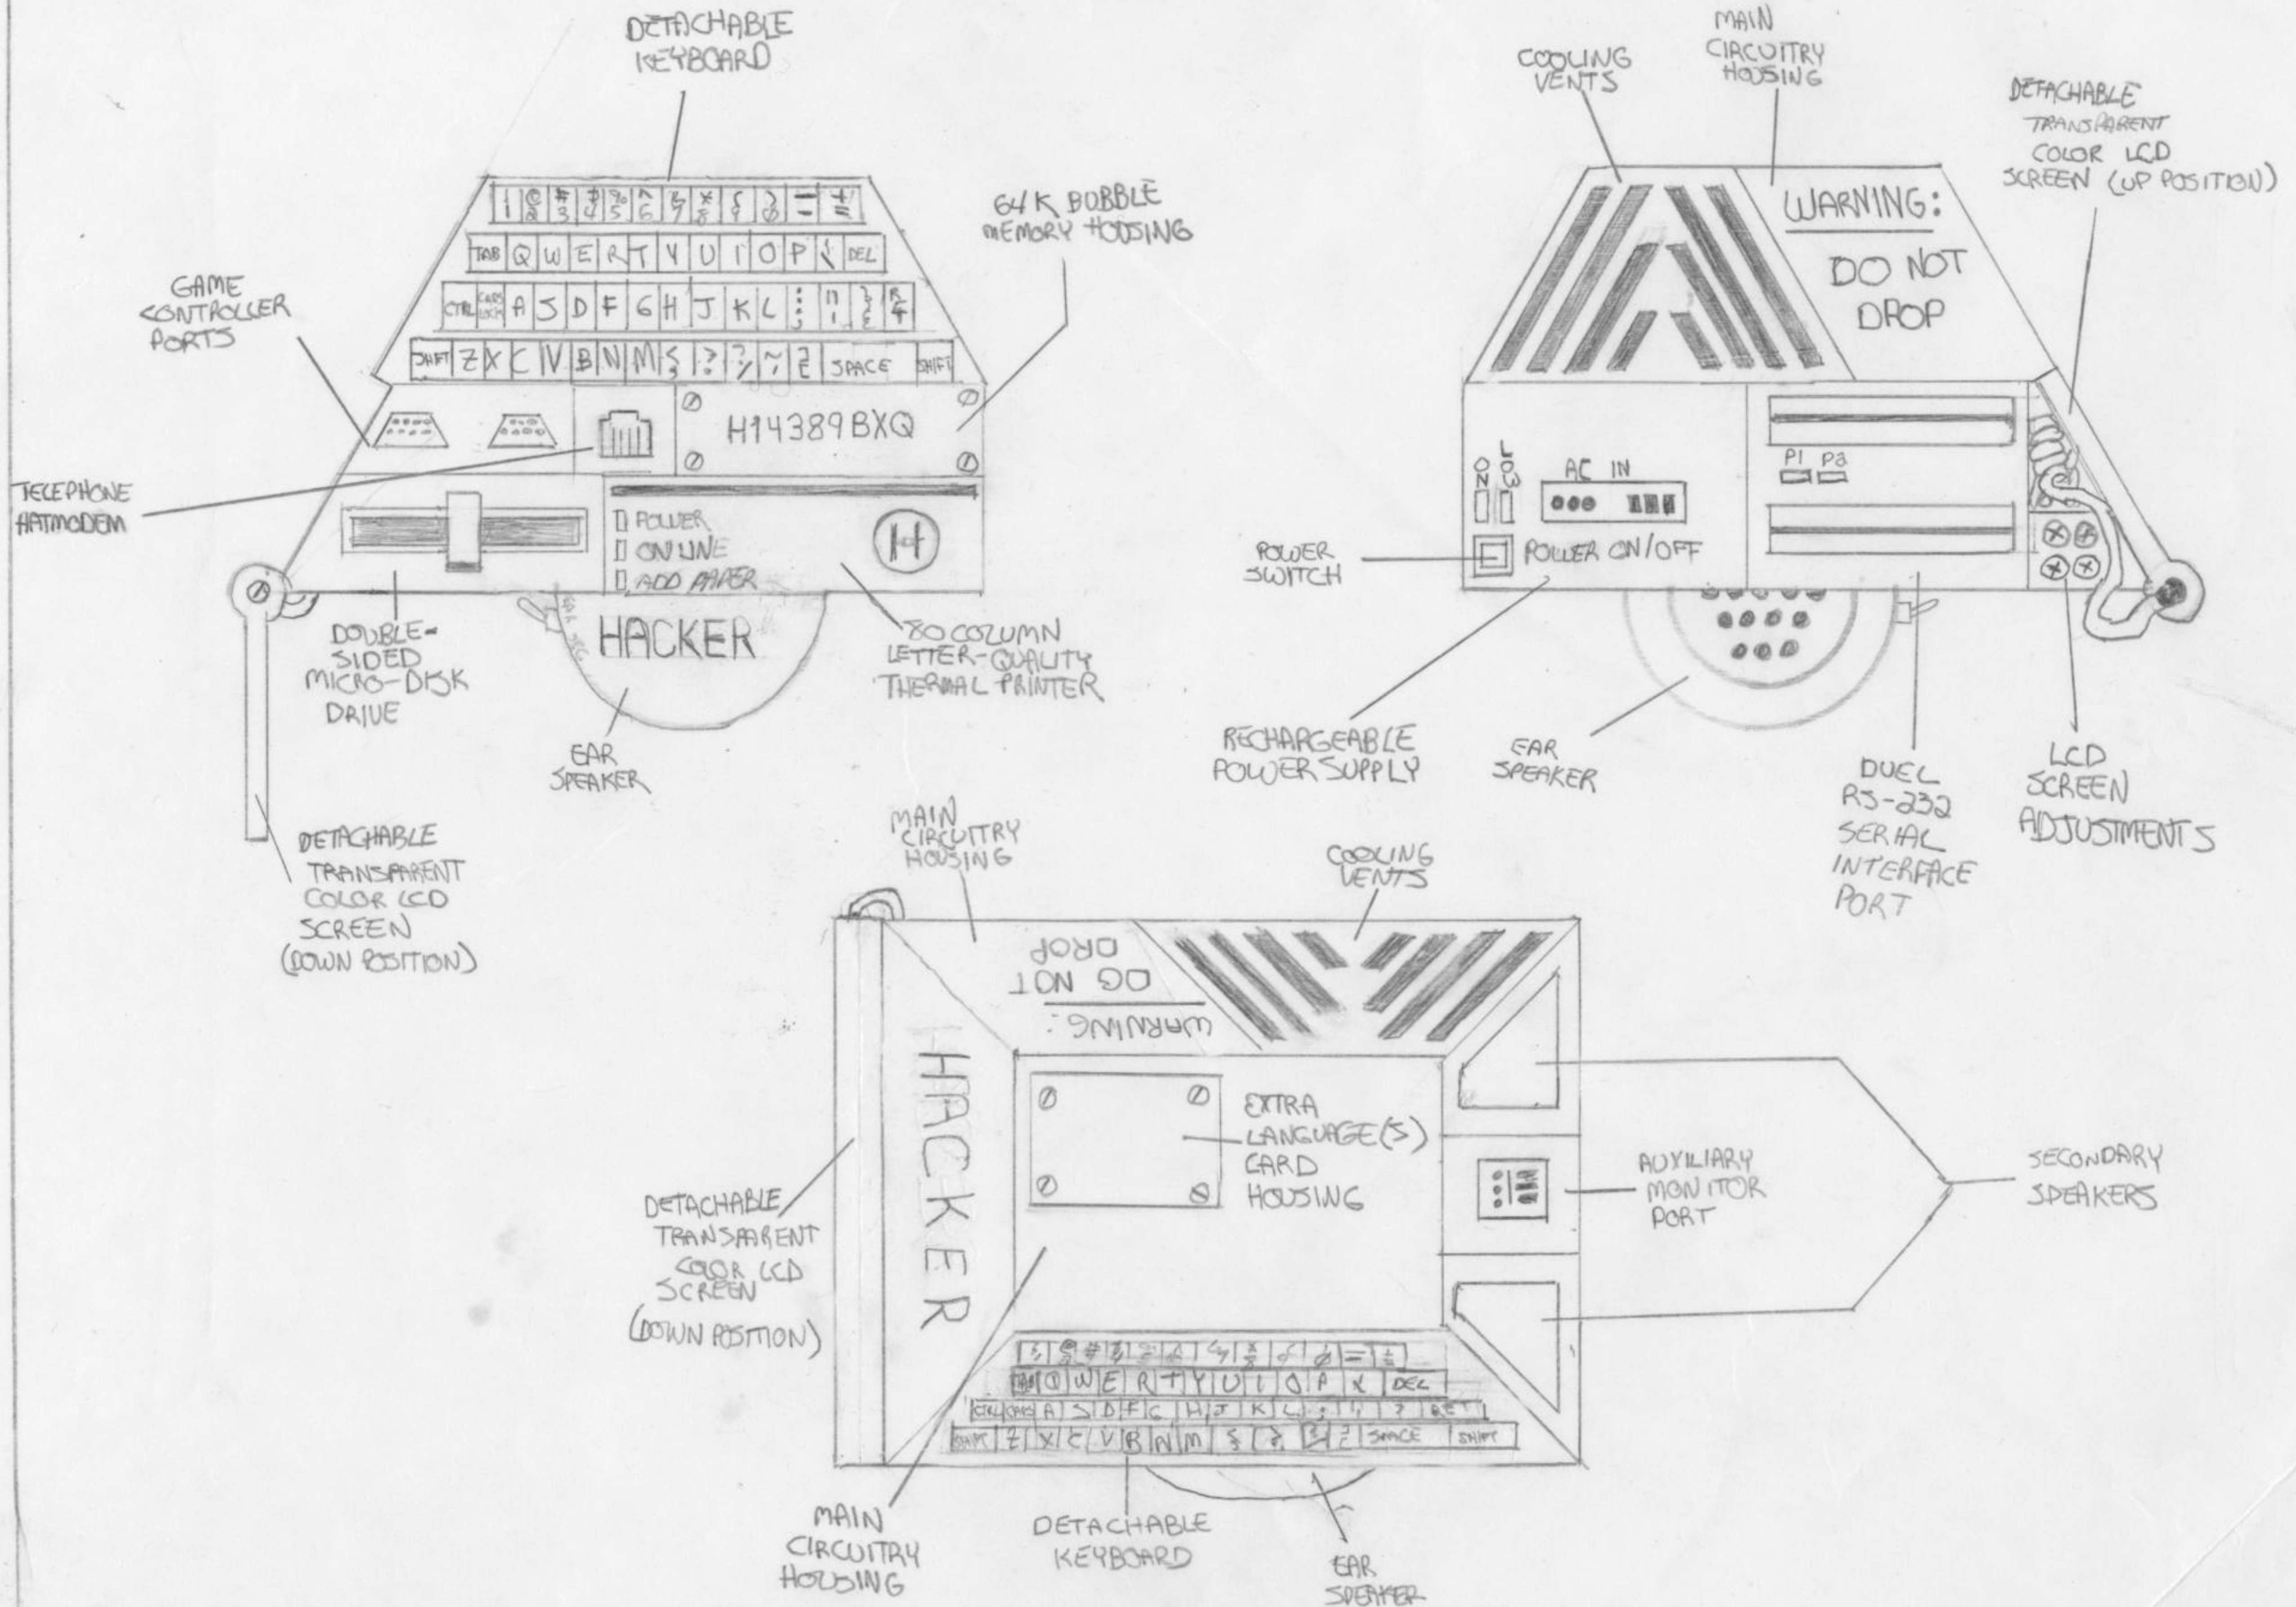

Look for the HACKER-HAT at the office of your nearest DMW Computer-Concepts distributor.

The HAT is now available in any color you want--as long as it's brown!
